PRESENTATION

PRODUCT CASE STUDY - ANALYSIS

INSURANCE PURCHASE JOURNEY

YUVAN KARTHIK G

EXECUTIVE SUMMARY

THE GENERAL IDEA

THE ANALYSIS

We're losing **49.4%** of users who start the insurance purchase journey.
That's **247 potential** customers walking away.

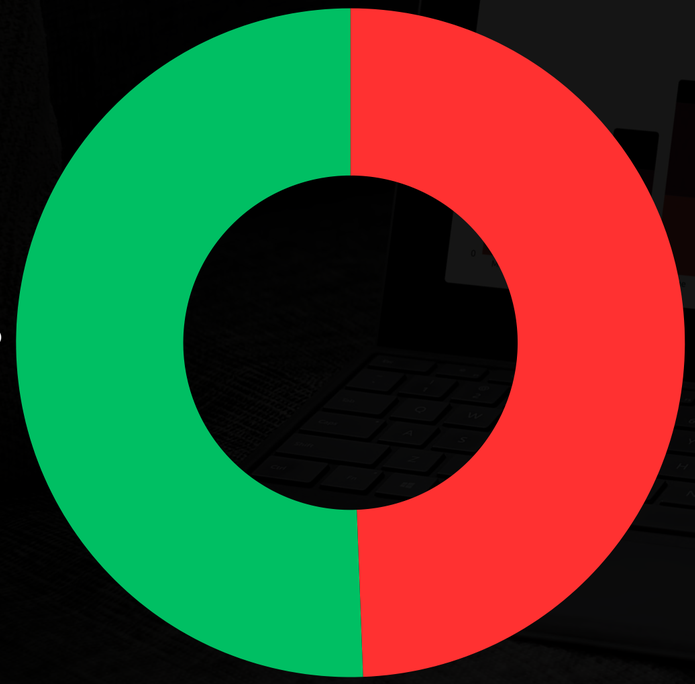

THE PROBLEM

Payment stage is the biggest leak - **120** users (**48.58%** of drop-offs) exit at payment.
Feedback & Insights confirm possible **cognitive overload**.

THE SOLUTION

"Simplifying payment decisions" to allow fast validation without disrupting pricing or policy.

PROBLEM STATEMENT

Completed Sign-Up
50.6%

Drop-Off's
49.4%

253/500

CURRENT STATE

500 users entered insurance purchase steps but only **253** completed signup

THE QUESTION

What's stopping users from completing their insurance purchase, and how do we fix it?

FINDINGS

50.6%

CONVERSION RATE

253 of 500 users

247

DROP-OFFS

49.4% abandon journey

120

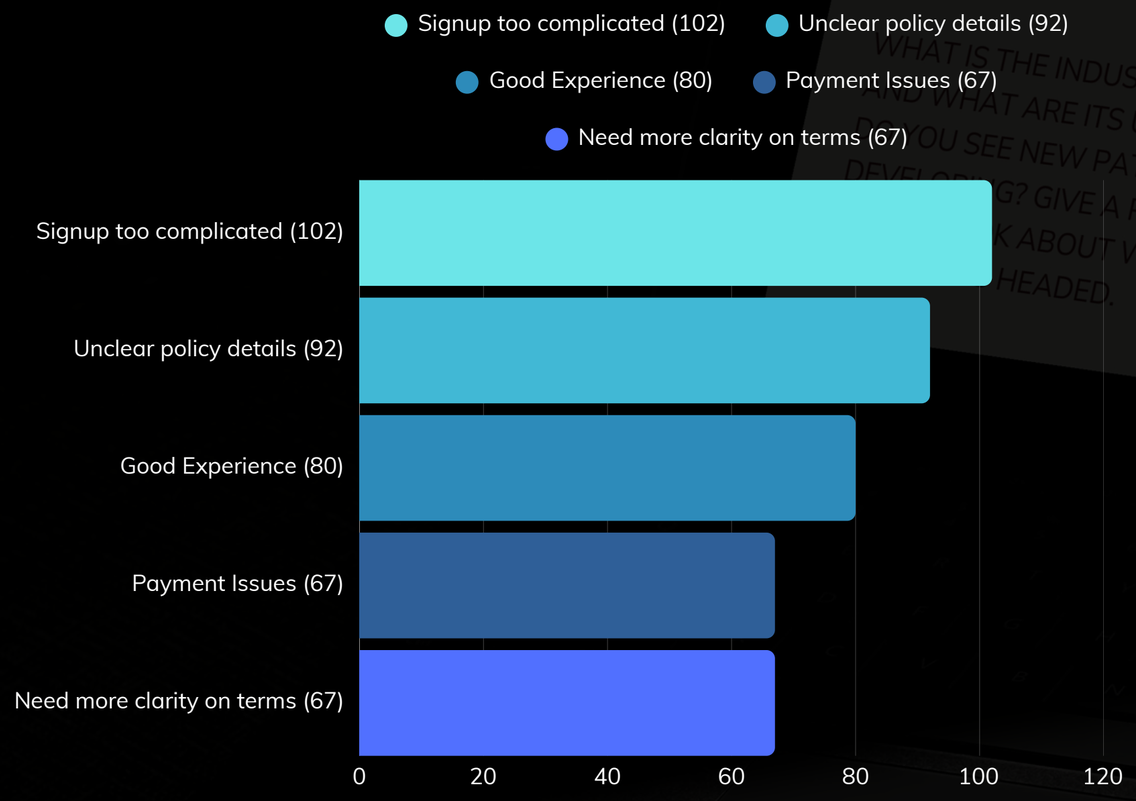

PAYMENT STAGE EXITS

48.58% of all drop-offs

WHERE USERS DROP OFF

FEEDBACK ANALYSIS

DROP-OFFS PAIN POINTS

102

FEEDBACK

"Signup too Complicated" is **#1** complaint **(102 mentions)**

INSIGHTS

- 112 users (49.6% of drop-offs) exit at payment.
- Feedback says signup issues because "Signup too Complicated" is **#1 complaint (102 mentions)**
- Based on feedback signals, **cognitive overload** is the most possible root cause. **Affordability** likely amplifies the issue for some users, but it may not the primary problem.

FEEDBACK ANALYSIS - PAYMENT

PATTERNS POINTING TO COGNITIVE OVERLOAD

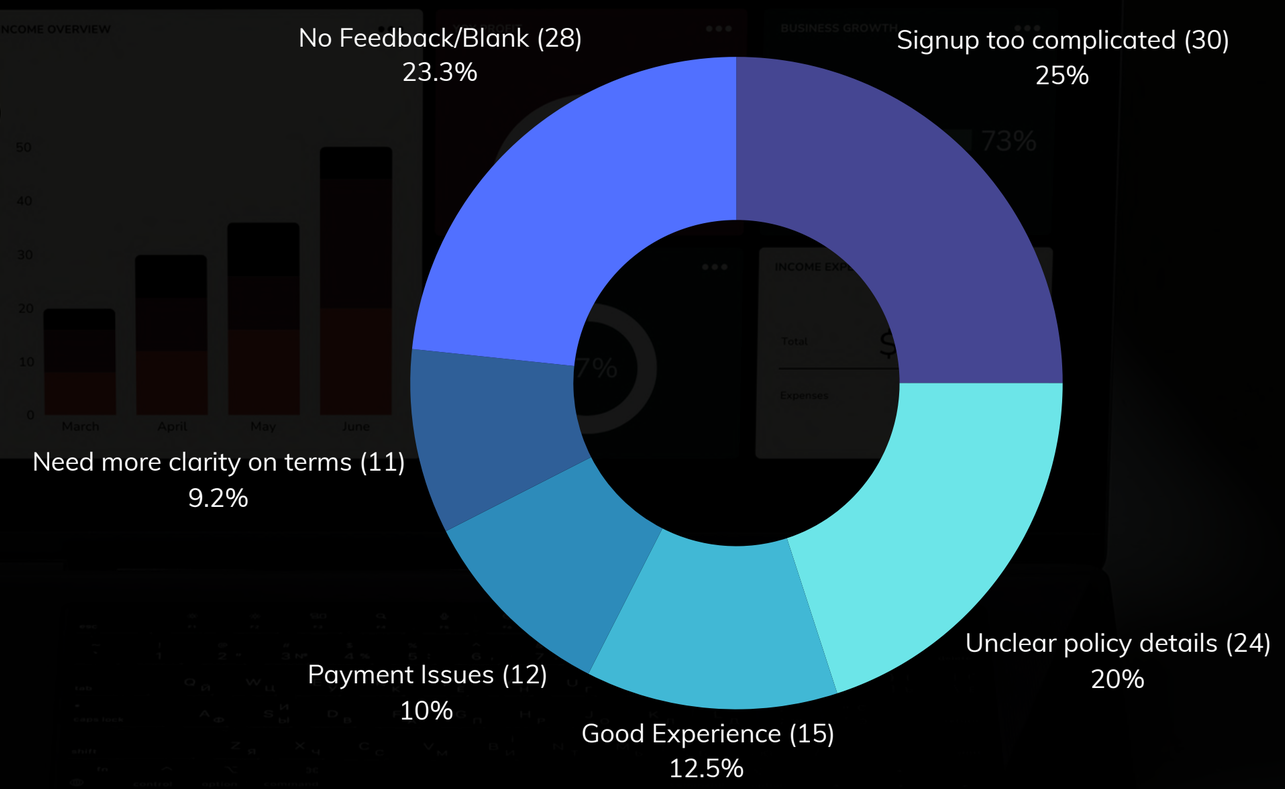

Analyzing Payment Drop-offs with feedback it was found

- **Direct complaints:** Only **12** said "Payment issues" (**10%**)

But looking at the indirect signals:

- 30 said "Signup too complicated" (**25%**)
  → **complexity at payment**
- 28 gave NO feedback (**23%**)
  → **possible silent exit**
- 24 said "Unclear policy details" (**20%**)
  → **considering other options maybe**

Total indirect signals: **82 users (68%)**

INSIGHTS

DATA BASED FINDINGS

1) FEEDBACK DOMINANCE

- ***"Signup too complicated" is highest among payment drop-offs***

- **Average Insurance premium** of payment **drop-offs** = **100.852** whereas of **completed signups** = **99.76** shows drop-offs do not have significantly higher premiums which rules out affordability

- Also **payment drop-offs does not decrease as salary increases** because there are **33** payment drop-offs with **salary <2000 AED** and **34** payment drop-offs with **salary >4000 AED.**

- **This also shows that drop-offs are spread across all salary bands.**

- If affordability were the issue, price-related feedback would dominate.

2) HIGH INTENT USERS STILL DROP

- ***The average intent score for :***
  Completed Signups = 5.48
  Payment Drop-offs = 5.36

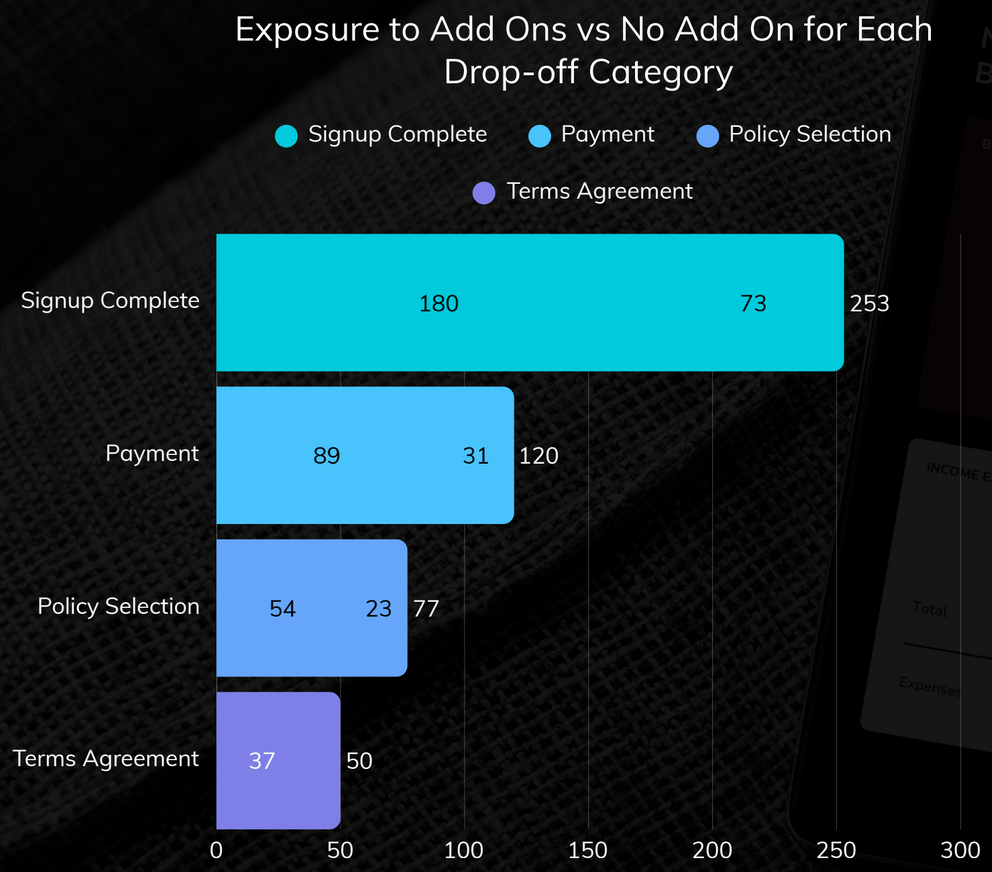

This shows that users wanted to buy and the problem was not the price

3) TIME ON PAGE INCREASES BEFORE DROP

- ***The average time (seconds) on page for:***
  Completed Signups = 120.38
  Payment Drop-offs = 126.38
  Combined Drop-offs = 122.5

Users who drop off at payment spend nearly the same amount of time as those who complete, indicating strong intent to finish the flow.
This suggests that abandonment is driven by difficulty in completing the final decision rather than due to price indicating COGNITIVE OVERLOAD.

INSIGHTS - ADD ONS

ADD-ON EXPOSURE INCREASES COGNITIVE LOAD AT PAYMENT

PAYMENT DROP-OFFS :
With add-on : 74.1%
Without add-on : 25.9%

TERMS AGREEMENT DROP-OFFS :
With add-on : 74%
Without add-on : 26%

POLICY SELECTION DROP-OFFS :
With add-on : 70.1%
Without add-on : 29.9%

- **Add-on exposed users are 72% more likely to drop at payment**
- **Feedback cites complexity, not cost**
- ***Users exposed to add-on options are significantly more likely to abandon at the payment stage.***
- ***Despite higher final prices, feedback from these users predominantly mentions “signup too complicated” rather than affordability(payment).***
- ***This clearly indicates decision overload at the time of payment.***

SOLUTION : SIMPLIFYING PAYMENT DECISIONS

WHY IT WORKS

- Payment drop-offs account for **49%** of all abandonments
- Top feedback at payment: “Signup too complicated”
- Users reach payment tell us that intent already exists
- Add-on exposure increases hesitation, not price rejection

WHY THIS WINS

- Targets the highest drop-off stage
- Solves complexity, not just symptoms
- Requires no pricing or policy changes
- Fast to build, easy to test, low risk

HOW IT WORKS

- Single, clear payment summary with final payable amount
- Optional add-ons hidden by default (progressive disclosure)
- Recommended payment option pre-selected
- One primary CTA: “Pay & Activate Policy”
- Lightweight reassurance at point of payment

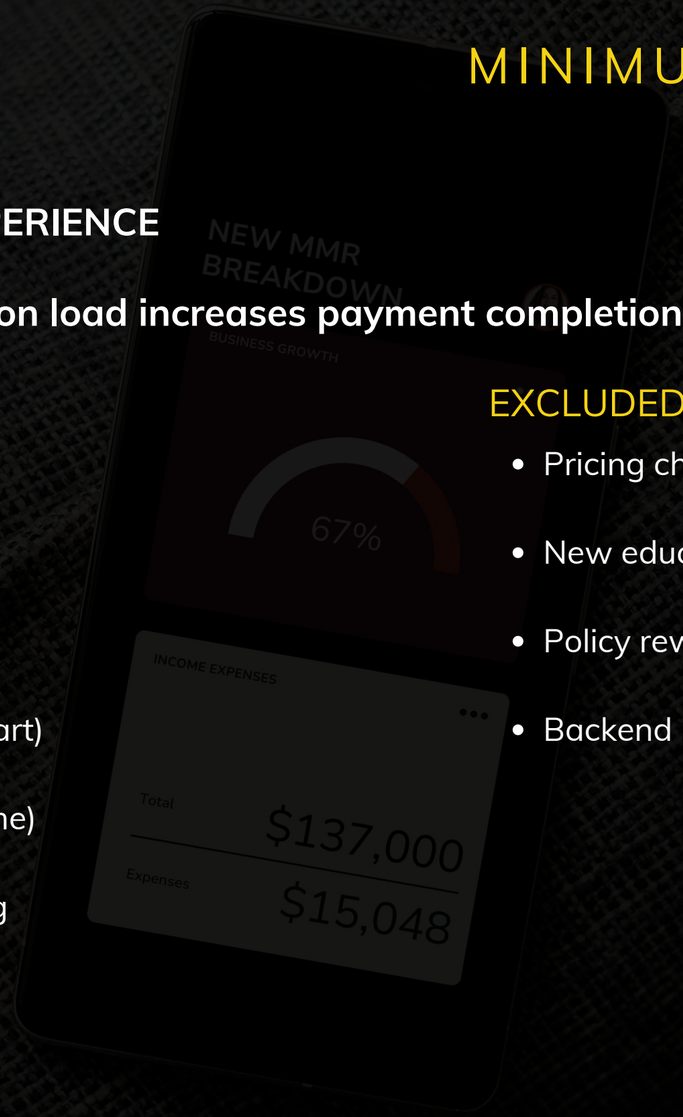

Users don’t reject insurance, they fail to complete a complex decision at the moment of payment.

SOLUTION - MVP

MINIMUM VIABLE PRODUCT

MVP SCOPE : **SIMPLIFIED PAYMENT EXPERIENCE**

GOAL : **Validate whether reducing decision load increases payment completion.**

INCLUDED

- Collapsed add-ons by default
- Clear cost breakdown (base + optional)
- Monthly payment auto-selected
- Inline trust cues (cancel anytime, coverage start)
- Progressive Disclosure (One Decision at a Time)
  → Directly reduces cognitive load
  → Allows users to proceed without rethinking
  → Helps with optional complexity

EXCLUDED

- Pricing changes
- New education flows
- Policy rework
- Backend payment changes

LAUNCH STRATERGY

PHASES

PHASE 1 : SOFT LAUNCH

- **15% of traffic in A/B test**
- (*15% of all users/visits are included in the new version while the remaining 85% continue seeing the old one*)
- Monitor for bugs and user confusion
- Monitor drop-offs, time on page, errors
- Gather qualitative feedback

PHASE 2 : FEEDBACK & OPTIMIZATION

- Refine and fine tune with feedback
- Improve add-on reveal experience
- Align support team

PHASE 3 : FULL ROLLOUT

- 100% of eligible users see option
- Monitor weekly improvements
- Prepare for follow-up and improvements like personalization, etc.

SUCCESS METRICS

HOW WE'LL MEASURE SUCCESS

PRIMARY KPI (KEY PERFOMANCE INDICATORS)

1) Overall Conversion Rate

- ***Baseline :*** **50.6%** *(253 ÷ 500)*
- ***Target :*** **70%+** (348+ ÷ 500) : Save around **90-100** of all drop-offs
- ***Expected Results :*** **70%+ overall conversion**

3) Other Metrices (Target + Check for decrease)

- *Payment retry / failure rate*
- *“Signup too complicated” feedback mentions*
- *Monitor customer support interactions*

SECONDARY KPI

2) Time to Complete

- ***Baseline :*** **126** seconds (drop-offs) / **120** seconds (completers)
- ***Target :*** **<90** seconds for all users
- ***Expected Results :*** **30%** reduction in time to complete

IMPACTS

EXPECTED IMPACTS

1) STARTING POINT

- Total users analyzed : 500
- Completed signup : 253 users (50.6% conversion)
- Dropped off : 247 users
- Dropped at PAYMENT stage : 120 users (Main target)

2) EXPECTED SCENARIO

- **Payment drop-offs :** 120 → 40-50% *reduction* = **60 saved** (120 × 0.50)
- **Policy Selection :** 77 → 30% *reduction* = **23 saved** (77 × 0.30)
- **Terms Agreement :** 50 → 25% *reduction* = **12 saved** (50 × 0.25)
- **Total Saved : 60 + 23 + 12 = 95 users**

- **NEW total completions :** 253 + 95 = **348 users**
- **NEW conversion rate :** 348 ÷ 500 = 69.6% ≈ **70%**
- **Improvement : +19 percentage points (39% relative lift)**

WHY **70%** is REALISTIC ?

Simplification of payment to help cognitive overload helps ALL drop-off stages

3) REVENUE IMPACT

- **Average premium** from dataset : AED 99.97/month
- Expectations : +95 customers = +AED 9497/month ≈ 9.5K (AED 114K/year)

And beyond revenue it improves customer sentiment, user trust & repeat usage which can act as strong foundations for future growth

ALTERNATIVE SOLUTIONS

AND WHY I DID'NT CONSIDER THEM

1) DYNAMIC PRICING

Offer cheaper "basic" plans at payment stage or even reduce pricing

Why I didn't choose it:

- May affect higher sales
- Doesn't address affordability it just shifts the problem
- Complex to explain and makes decision-making harder.

2) POLICY COMPARISON TOOL

Side-by-side comparison at Policy Selection stage which addresses "unclear policy details"

Why I didn't choose it:

- Good idea but targets smaller problem
- Policy Selection drop-offs = 77 users (vs 120 at payment)
- The current solution will have better ROI because it helps solve more than one problem

3) INSURANCE SAVINGS POT (PRE-PAYMENT PLAN)

A user saves weekly in a locked "insurance pot," and after weeks, the policy auto-activates with a gamified progress bar and savings reminders.

Why I didn't choose it:

- Doesn't help if users want coverage NOW, not in 3 weeks
- Issue was not with affordability
- Delayed benefits is not suitable for insurance
- More complex build (savings account integration)

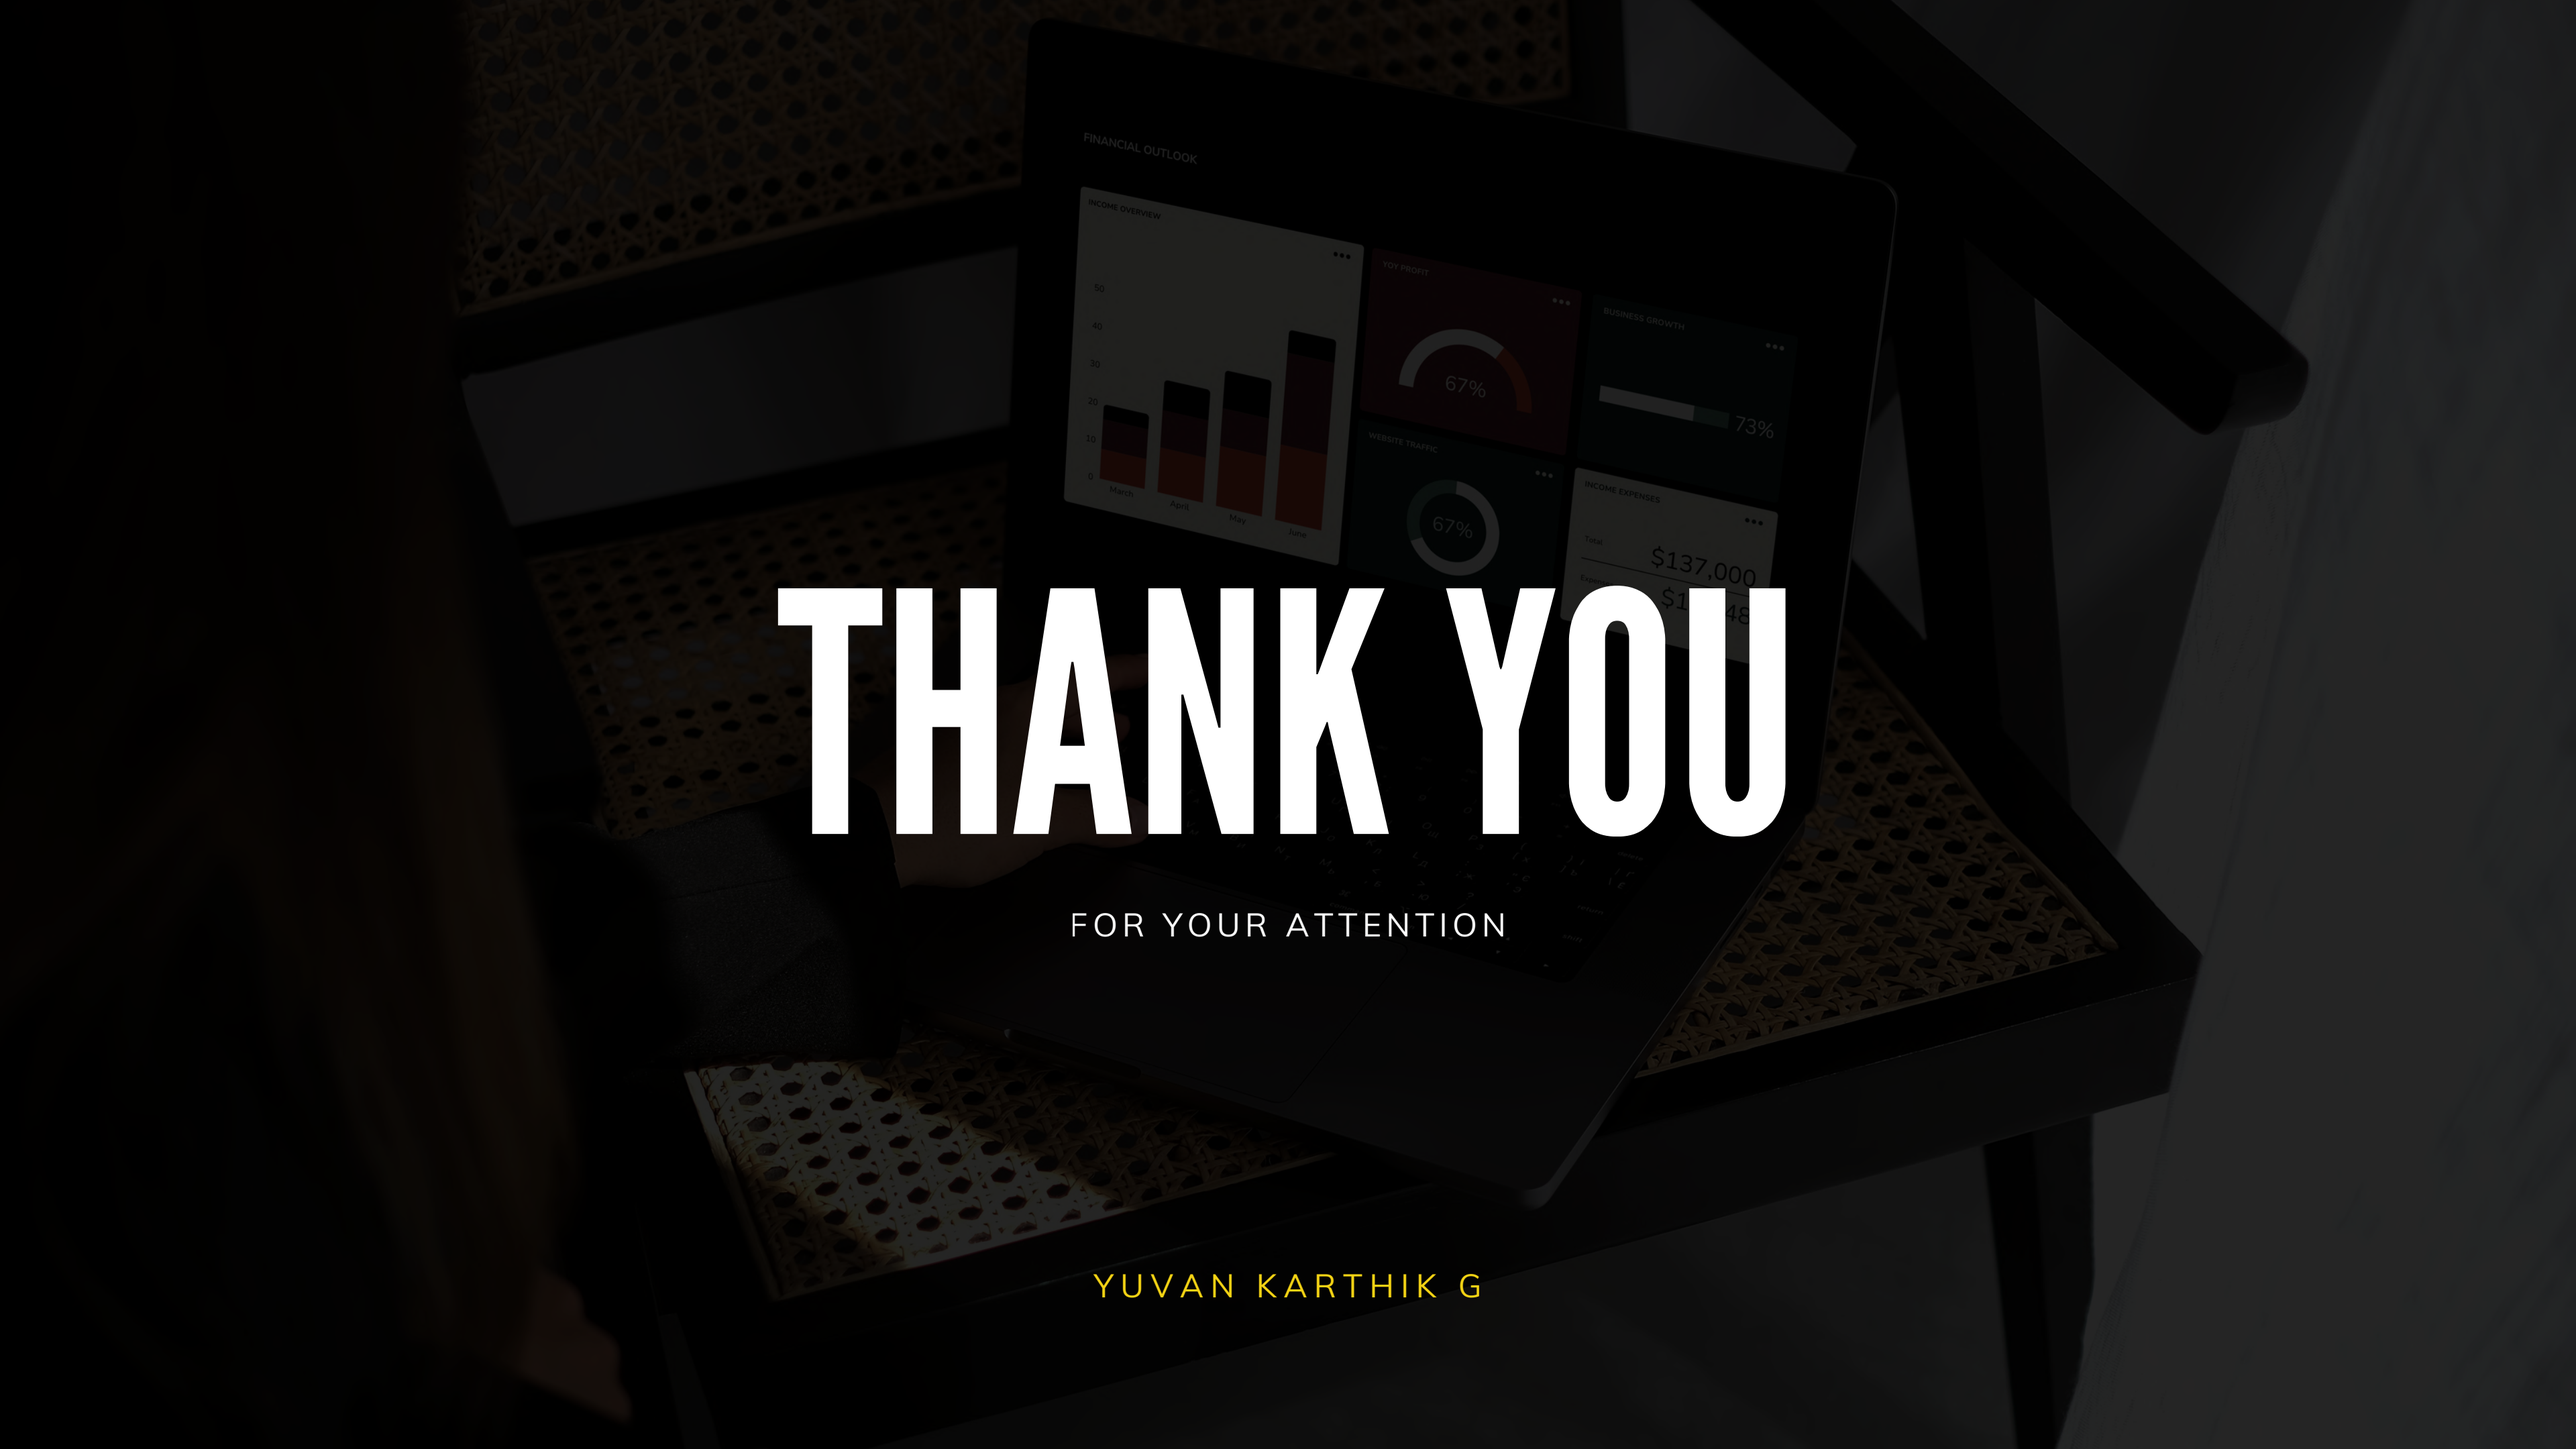

CONCLUSION

THE PATH FORWARD

- The Opportunity is ***CLEAR***
- **The Problem** : **Payment** is the single biggest conversion bottleneck and data points to ***cognitive overload***, not affordability
- **The Solution** : ***Simplifying payment decisions*** is the highest-impact, lowest-risk option. The MVP allows fast validation without disrupting pricing or policy
- **The Impact** :
  +19% conversion rate improvement
  +95 insured customers per 500
  +AED 114K annual revenue from this feature alone

By reducing decision complexity at the moment of payment, we can unlock meaningful gains without changing price, policy, or eligibility making this the most efficient and defensible solution...

THANK YOU
